Processing with `pdflatex`: demand and test

Ernst Reissner (rei3ner@arcor.de)

January 1, 1970

Tests magic comment: overwrite default LATEX processor, which is `lualatex` by default, by `pdflatex`. If this does not work, an invisible `\GenericError` in an `\ifPDFTeX` construction throws an error leading to an error return code of the late processor.

Here, it is tested that LATEX processor is chosen correctly for compilation 'testProgramNoLatexmk' without latexmk.
